

Startup ID Creation Module

End-to-end functional wireframes — Format Builder, Location Master, Digital ID Card, round & program controls

TR26–GOM–UDPR–000326

Reference format — State · Year of Recognition · District · Sub-Division · State-wide serial (each segment independently on/off & reorderable per tenant)

Status	DRAFT WIREFRAMES — structural planning aid, not final visual design. Feature spec status is also draft, not approvable pending open questions (see Appendix, p.14).
Scope legend	PART 1 Startup ID module — grounded in reviewed BRD v1.4 + backend design doc, code-verified · PART 2 Program/round toggles (reapply cooldown, restrict-to-Startup-ID) — rough requirement, needs its own design pass before build
Sources	BRD_Startup_ID_Creation_Module_v1.4.pdf · Startup-Recognition-ID-Design.pdf (sc-saas-backend) · Tripura/TRISE reference card image · specs/features/SAN-253-startup-id-creation-module.spec.md
Repos touched	sanchiconnect-saas-tenants · sc-saas-backend · sanchiconnect-saas-tenants-admin (new surface) · sc-saas-admin · sc-saas-frontend

3. **03** Admin Portal — Startup ID Format Builder **PART 1**

4. **04** Admin Portal — Location Master **PART 1**

5. **05** Admin Portal — Digital ID Card Design Builder **PART 1**

6. **06** Tenant Settings — Digital ID Card toggle **PART 1**

7. **07** Round configuration — Generate Startup ID + Freeze Application **PART 1**
8. **08** Program creation, step 1 — Reapply + Restrict-to-Startup-ID **PART 2**

9. **09** Startup registration form — Sub-Division field **PART 1**

10. **10** Applicant-facing flow — login gate & eligibility message **PART 2**

11. **11** Startup account page — Startup ID display **PART 1**

12. **12** Printable Digital ID Card **PART 1**

13. **13** Appendix — open questions index

01 • Conventions used throughout

These are structural wireframes — layout & logic, not final visual design. Colour/branding in the actual product may differ; the BRD's own high-fidelity comps (indigo/violet, card-based) remain the visual reference.

-  Dashed box — an image, logo, or photo-panel **asset placeholder**. In the real screen this is an uploaded file, not typed content.
-  Draggable chip — an ID-format segment (Format Builder) or a layer (Card Design Builder). Reorderable by drag in the real screen.
-  Open-question flag — this exact point is **not yet decided** by product/dev lead. Full text of every flagged question is indexed in the Appendix (p. 14), cross-referenced to the feature spec.
-  Screen is grounded in the reviewed BRD v1.4 and verified against real code by the feature spec — ready to be built once its own open questions close.
-  Pill toggle — a boolean setting. Filled/indigo = on, grey = off. Used for every module & round/program flag in this feature.
-  Numbered annotation — points to a specific piece of behaviour, explained in the numbered list directly beneath that wireframe.
-  Marks a UI element that does not exist in the product today — everything else on that screen is an existing control, shown for context only.
-  Screen illustrates a **rough, unreviewed requirement** only. Layout shown is one plausible resolution, not an approved design — needs its own BRD/design pass first.

TWO STRUCTURALLY SEPARATE APPLICATIONS APPEAR IN THESE WIREFRAMES

Admin Portal (sanchiconnect-saas-tenants-admin) — the platform-operator tool Sanchi's own staff use across every tenant, via a tenant switcher. No tenant login can reach it, at any role. Dark sidebar chrome in these wireframes.

Tenant-side apps (sc-saas-admin, sc-saas-frontend) — what a tenant's own staff and startups actually use day to day. Light sidebar chrome in these wireframes. Tenant side only ever gets *one* control for this whole module: the Digital ID Card on/off toggle (p. 6).

02 · End-to-end flow, actor by actor

PLATFORM OPERATOR

1 · Configure ahead of go-live

— Format Builder + Location Master + Card Design Builder for the tenant, in the Admin Portal (p. 3–5). Invisible to the tenant until they flip their own toggle.

TENANT ADMIN

2 · Flip "Digital ID Card" ON

— the tenant's single module toggle in Settings (p. 6). Authorises generation; grants no visibility into format/location/card config.

PROGRAM MANAGER

3 · Program creation, step 1

PART 2

— set Reapply-after-Rejection (+ cooldown) and Restrict-to-Startup-ID-holders (+ dynamic message) (p. 8).

PROGRAM MANAGER

4 · Round creation/edit

PART 1

— set Generate Startup ID and Freeze Application per round, beside existing jury controls (p. 7).

APPLICANT

5 · Applies to the program

PART 2

— if Restrict-to-Startup-ID is on: login gate → Startup ID check → pass or see the admin's dynamic eligibility message (p. 10). New Sub-Division field on the profile form if the tenant's module is on (p. 9).

BACKEND (ROUND-ENTRY)

6 · Application enters the round

— if
generate_startup_id
+ tenant flag are both true: atomically mint
recognition_id
exactly once, from the tenant's saved format. If
freeze_application
is true: application is now locked to this round, no further moves.

APPLICANT / TENANT ADMIN

7 · Startup ID appears

— read-only summary + segment breakdown on the startup's account page (p. 11) and on the admin's startup detail page; printable Digital ID Card (p. 12) renders the tenant's active template with this startup's data bound in.

Serial No.4

TR26-GOM-UDPR-000326

Live preview — updates instantly on every drag, before saving

FORMAT CHANGE & REGENERATION 5

3,482 Startup IDs will be regenerated under the new format. Source values are preserved — only the assembled string changes.

Confirm & Regenerate All

- 1

Every segment type — including State Code and Serial No. — lives in the same removable palette. Nothing is core or locked.
- 2

Reordering happens live; the preview string below updates on every drag, before anything is saved.
- 3

District/Sub-Division codes come from the Location Master registry match (p. 4) — never typed here.
- 4

Removing Serial No. from the visible format does not stop its counter running in the background — it's the collision-safe backstop if other segments repeat.
- 5

Regeneration is async, chunked, and fully audited (actor, timestamp, before/after snapshot) — see spec §Format-change flow.

NAME	CODE	SOURCE	STATUS	
Gomati 12 Startup IDs issued	GOM	Standard Registry (IN-LGD)	Active	Edit · Deactivate
West Tripura	WTR	Standard Registry (IN-LGD)	Active	Edit · Deactivate
Dhalai	DHL	Standard Registry (IN-LGD)	Inactive	Edit · Deactivate
Sepahijala 1	SEP	Manual entry	Active	Edit · Deactivate

NEW ENTRY — SEARCH "UNAKOTI" 2

Matched in registry: UNK from Standard Geography Registry — not a guess, edit only if no match found

Save Entry

- 1 Districts/Sub-Divisions with no match in the Standard Geography Registry (e.g. an unseeded region) fall back to a flagged manual entry — distinct from a registry match, not an equally-trusted guess.
- 2 Hub/Spoke tabs work differently: no registry exists, so the code field is auto-suggested from the first 3 letters of the name and is editable before saving.

Font size / Colour

14pt / #FFFFFF

CR80 card ratio · 85.6 × 54mm · 300 DPI

- 1

Static layers (background, logos, photo panels) render identically on every card; bound layers resolve to each startup's real data at render time — same template, personalised output.
- 2

No free-form code or markup — every property is set through this panel. Saving applies immediately; unlike a format change, a card redesign never triggers regeneration (it's presentation-only).

06 · Settings — Digital ID Card toggle

PART 1

Startup ID

Certificates & Digital ID Cards

Settings

PLATFORM MODULES — EACH TOGGLE TURNS A MODULE ON/OFF FOR THIS TENANT

Certificates

Issue & publicly verify participation/completion certificates.

Digital ID Card

THIS MODULE

Format, location codes, and the card's visual design are all configured centrally in the Admin Portal — there is nothing further to set up here.

Gamification

Points, badges, leaderboards across programs.

Jury Scheduling

Allow jury to request a live call with the applicant.

i This single toggle is the **entirety** of tenant-side control for this module — no format screen, no location master, no card design, ever appear here. Any role with ordinary Settings access can flip it. Turning it off later does not retract Startup IDs already issued.

Application Management / Rounds

Configure Round — Round 2: Shortlisting

ROUND SETTINGS

Round name: Round 2 — Shortlisting

Rating method: Weighted rubric

Opens: 10 Mar 2026 · Closes: 24 Mar 2026

EVALUATION & PROGRESSION CONTROLS

Jury Auto-Allotment

EXISTING

Automatically assign jury on round entry.

Generate Startup ID

NEW

Mint a Startup ID the first time an application enters this round.

Requires the Digital ID Card toggle ON (Settings, p. 7)

Freeze Application

NEW

Once entered, this round locks the application in place — it can no longer move.

Freeze Application has no admin override in Phase 1 — reversing a misrouted freeze needs a direct data correction.

Both new toggles render only when the tenant's Digital ID Card module is on; Generate Startup ID additionally greys out with a tooltip if the module toggle itself is off, so it never silently no-ops. Generation is idempotent — a startup with an existing Startup ID is never re-generated on a later round entry.

08 · Program creation, step 1 PART 2

▸ enforcement layer & storage undecided

⚠ Rough requirement, not yet in a reviewed BRD. This screen is one illustrative resolution only — needs its own design pass before implementation (see Appendix, p. 14).

SanchiConnect

Create Program

Step 1 of 4 — Program Basics

BASICS

Program name: [_____]

Category: [Select ▼]

Application window: [__] to [__]

ELIGIBILITY & REAPPLICATION 1

Allow reapplication after rejection NEW

Rejected candidates may apply again after a cooldown.

Cooldown before reapplying: [30] days ▸ per-program or per-round?

Restrict to Startup ID holders only NEW

Only applicants who already hold an active Startup ID may apply.

Message shown to applicants without a Startup ID: 2

"Only startups with an active Startup ID can apply to this program. Contact your program's nodal office to get recognised first."

1

Set here at program-creation step 1, per the source requirement — but whether the cooldown is later enforced at submit-time (backend) or only gates the reapply button (frontend) is undecided. Existing

rejectedOn / isReapplied

columns on the round-submission entities are plausible prior art, not yet confirmed as the mechanism.

2

This free-text message is set by the admin/program manager at the moment they enable the toggle. Existing

rejectionMessage

columns on both round-submission entities are plausible prior art for where this could live — not yet confirmed.

Startup ID Creation Module — Wireframes

p. 9

09 · Registration form — Sub-Division field PART 1

no District level exists today — see below

Code-evidenced correction: the source brief assumes an existing Country→State→District cascade to hang Sub-Division from. The actual current cascade (verified in step-one-company-info.component.ts) is Country→State→City — there is no District field anywhere in the product today. The layout below is one illustrative resolution (a flat, registry-searched Sub-Division picker, independent of a District step) — not a confirmed design. See Appendix.

STARTUP REGISTRATION

Complete Your Startup Profile

Step 2 of 4 — Location & Registration Details

Country: [India ▼]
State: [Tripura ▼]
City **EXISTING** : [Agartala ▼]
Sub-Division **NEW** **1**: [search: "Udaipur" ▼]

WHY AM I SEEING SUB-DIVISION?

This program issues Digital ID Cards — Sub-Division completes your code's segment and is matched against the Standard Geography Registry, not free text. Field only appears when the tenant's Digital ID Card module is on.

1 Shown here as an independent, registry-searched picker rather than a dropdown cascading from District, since no District selector exists in the product to cascade from. Whether this feature should instead introduce a first-class District field first is an open question — see Appendix.

10 · Application eligibility flow

PART 2

frontend-only vs backend-enforced

⚠ Rough requirement — UI flow below (login gate → Startup ID check → message) is illustrative, not an approved design.

¹ The message text shown here is exactly what the program manager configured at program-creation step 1 (p. 9). Whether this check (and message-serving) also happens at the backend on direct API submission, not only in this frontend gate, is an open question — this workspace has a documented precedent of a different flag being bypassable via direct API call when only checked at render time.

11 • Startup account page

PART 1

My Account

State	Year	District	Sub-Div.	Serial

Mirrors the tenant's currently active format — a format change later regenerates this code (p. 4).

Download as PDF

TIMELINE

- Application submitted — 02 Feb 2026
- Entered Round 2 — Shortlisting — 12 Mar 2026
- Startup ID generated — 12 Mar 2026
- Round 3 — Final Pitch — pending

i Stored/assembled as `recognition_id` , not `startup_id` — that name is already the FK-to-startup convention across 30+ existing tables in the backend; reusing it would collide.

12 · Printable Digital ID Card PART 1

Generic placeholder mock — layout only. The real per-tenant branding/photography is whatever the Admin Portal operator configured in the Card Design Builder (p. 6); no real logos, photography, or government branding are reproduced here.

- i Exactly 4 data points appear on the card face: Company Name, Startup ID (shown as one opaque string — no segment breakdown), Recognised Year, and a QR code. The QR's destination (assembled code vs. a static URL) is configurable per template; no public verification page exists for it to resolve to in this phase.

13 · Appendix — open questions indexed by wireframe

Full text lives in `specs/features/SAN-253-startup-id-creation-module.spec.md` § Open questions. Nothing below is resolved by this document — it exists so no flagged item gets lost between wireframe and build.

p.4 Serial-counter overflow past 999,999 — hard stop vs. extend to a 7th digit. [DESIGN DECISION PENDING]

p.5 Hub/Spoke capture mechanism at generation time — no profile field exists for either today. [DESIGN DECISION PENDING]

p.5 Standard Geography Registry country coverage beyond India/LGD, and the unseeded-region fallback experience. [NOT SPECIFIED IN SOURCE]

p.6 Card asset upload constraints — formats, size/resolution, RGB vs. CMYK. [NOT SPECIFIED IN SOURCE]

p.6 Whether the pre-existing `startup_id_cards` flag/module family converges with, is retired by, or runs permanently alongside this new one. [DESIGN DECISION PENDING]

p.8 Which Round entity family/families get `generate_startup_id/freeze_application` — two independent parallel families exist in the codebase today. [DESIGN DECISION PENDING]

p.8 Freeze Application "unfreeze" override — confirmed not built this phase; direct DB correction only. resolved, kept for traceability

p.9 Reapply cooldown: frontend gate vs. backend-enforced at submit; scoped per-program or per-round; which entity/columns track it (existing `rejectedOn/isReapplied` are plausible, unconfirmed prior art). [DESIGN DECISION PENDING]

p.9 Where the dynamic eligibility message is stored (existing `rejectionMessage` columns are plausible, unconfirmed prior art). [NOT SPECIFIED IN SOURCE]

p.9 Whether generation should block for a legacy startup with no Sub-Division on file, or proceed with that segment omitted. [DESIGN DECISION PENDING]

p.9–10 No District level exists in the product today (only Country→State→City) — does this feature need to introduce one, or does Sub-Division resolve independently? [DESIGN DECISION PENDING]

p.10 Restrict-to-Startup-ID gate: redirect-to-login vs. inline prompt; frontend-only vs. backend-enforced (this workspace has a documented precedent of a flag being bypassable when only checked at render time). [DESIGN DECISION PENDING]

all Admin Portal screens Cross-application service-to-service auth (Admin Portal → tenant backend) — the only existing precedent for this call shape is currently unauthenticated. [DESIGN DECISION PENDING]

general Whether reviewer/recruitment_partner/jury/program_manager/analyst Admin Portal roles genuinely have zero need for these screens — assumed, not validated. [NOT SPECIFIED IN SOURCE]
